Deadly sins of cloud computing of research

sin (n .) - common simplification or shortcut employed by researchers; may present threat to scientific integrity and practical applicability of research

- ▶ Sin 1: unnecessary distributed parallelism
- ▶ Sin 2: assuming performance homogeneity
- ▶ Sin 3: picking low-hanging fruit
- ▶ Sin 4: forcing the abstraction
- ▶ Sin 5: unrepresentative workloads
- ▶ Sin 6: assuming perfect elasticity
- ▶ Sin 7: ignoring fault tolerance

7 Sins

unnecess. parallelism
assume homogeneity
low hanging-fruit
forcing abstraction
unrep. workloads
sins 6/7

Resource Mngment

resource model
challenges
techniques

References

Unnecessary distributed parallelism...

- ▶ ... is not free
- ▶ ... has diminishing returns

(overhead)

(scalability)

Suggestion: (1) compare to serial, (2) case-by-case decision

Assuming performance homogeneity...

- ... despite unknown environment (availability, load, hw)

Disk read performance

100 EC2 m1.small instances

Mean and standard deviation over 9 samples

Suggestion: rigor¹, repeatability², reproducibility³

¹repeat experiments, error bars, quantify variance, explain outliers/results

²repeat at different times/hardware

³hardware config, communication network, datasets

Picking the low hanging fruit...

- ▶ ... is not compose-able or hard
- ▶ ... the ideas never change⁴

Figure 1: Maximum speedups over Hadoop claimed by a selection of research endeavours; N.B. log-scale y-axis.

Suggestion: (1) quantify costs (2) vs. “best-of-breed”

⁴(1) in-memory caching, (2) memoization, (3) exploit data locality, (4) domain-specific algs., (5) load vs. job runtime tradeoff

unnecess. parallelism
assume homogeneity
low hanging-fruit
forcing abstraction
unrep. workloads
sins 6/7

- resource model
- challenges
- techniques

Forcing the abstraction...

- ▶ ... because not every job is designed for MR
- ▶ ... adds layers (Hive, Pig Latin, FlumeJava, etc.)

Image taken from <http://dhuxxcuqauxw8.cloudfront.net>

Suggestion: (1) domain-specific systems (2) > data

7 Sins

unnecess. parallelism
assume homogeneity
low hanging-fruit
forcing abstraction
unrep. workloads
sins 6/7

Resource Mngmt

resource model
challenges
techniques

References

Unrepresentative workloads...

- ▶ ... are homogenous (same job/nature)

Image taken from <http://veggieab.com/wp-content>

Suggestion: new benchmarks (interference, types, spin-up)

- unnecess. parallelism
- assume homogeneity
- low hanging-fruit
- forcing abstraction
- unrep. workloads**
- sins 6/7

- resource model
- challenges
- techniques

Sins 6 and 7

Assuming perfect elasticity...

- ▶ ... expects infinite parallel speedup

Ignoring fault tolerance...

- ▶ ... can be a quantification for the speedup

Suggestion: argue for/against feature for the given workload

7 Sins

unnecess. parallelism
assume homogeneity
low hanging-fruit
forcing abstraction
unrep. workloads
sins 6/7

Resource Mngment

resource model
challenges
techniques

Conclusion

- ▶ Sin 1: unnecessary distributed parallelism
→ (1) compare to serial, (2) case-by-case decision
- ▶ Sin 2: assume performance homogeneity
→ rigor, repeatability, reproducibility
- ▶ Sin 3: picking low-hanging fruit
→ (1) quantify costs (2) vs. "best-of-breed"
- ▶ Sin 4: forcing the abstraction
→ (1) domain-specific systems (2) > data
- ▶ Sin 5: unrepresentative workloads
→ new benchmarks (interference, types, spin-up)
- ▶ Sin 6/7 perfect elasticity, ignoring fault tolerance
→ argue for/against feature for the given workload

"While we do not believe that this invalidates existing research, we see a danger of these sins becoming entrenched in the research agent and methodology."

- Schwarzkopf et al.

Resource management challenges

Scaling causes all kinds of problems!

- ▶ organization: collect inventory? manage users?
- ▶ heterogeneity: ++machines? attach storage? migrate?
resource islands and load balancing? cluster-wide
metrics? resource pool operations? processor speeds?
compatibility between VM hosts?
- ▶ failures

References

Scaling techniques

hierarchical: layer resource management systems

? cluster metrics, load balance, manage resource pools

flat: distributed/decentralized resource management system

? compatability, >> failure models, consistency

statistical: smart operations at a small scale (repartition)

? manage resource pools
